### HOW TO REPLY TO THIS NOTICE:

#### I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

**IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.**

**DETAILED ACTION**

***Allowable Subject Matter***

1. Claims 11-20 are allowed.
2. The following is an examiner's statement of reasons for allowance:

**Claims 11 and their dependents thereof, are allowed** because the closes prior art, MacNally (US Patent No. 5,516,185), Shi (US 2004/0081256) , Simmons (US 2004/0053586), Anim-Appiah (US 2004/0100898) , Allott (US 2002/0160738), Shibuya (US 2002/0016158), either alone or in combination, fails to anticipate or render obvious a direct conversion reception apparatus for use in a system where transmit power varies between transmission signals by downlink transmit power control, the apparatus comprising:

a reception quality measurement section that measures reception quality of a first signal of an earlier received frame that is comprised of a plurality of time slots, the reception quality being measured on a per time slot basis;

a gain estimation section that estimates gains for amplifying a second signal of a later received frame, the gains being estimated on a per time slot basis, before a reception period of the later received frame, based on the reception quality of individual time slots measured by the reception quality measurement section;

a gain control section that selects, on a per frame basis, a maximum gain from the gains of individual time slots estimated by the gain estimation section, and performs gain control, on a per time slot basis during the reception period of the later received frame; and

a voltage calibration section that calibrates an offset voltage of the second signal of the later received frame on a per frame basis, before the reception period of the later received frame, using a calibration value matching the maximum gain selected by the gain control section.

Specifically, MacNally, Shi, Simmons, Anim-Appiah, Allott, Shibuya, either alone or in combination, fail to teach estimating, before receiving a signal, a gain to be applied to the signal and calibrating an offset voltage, to be applied to a signal, before receiving the signal.

**Claims 17-18 are allowed** because the closes prior art, MacNally, Shi, Simmons, Anim-Appiah, Allott, Shibuya, either alone or in combination, fails to anticipate or render obvious a direct conversion reception method for use in a system where transmit power varies between, transmission signals by downlink transmit power control, the method comprising the steps of:

measuring reception quality of a first signal of an earlier received frame that is comprised of a plurality of time slots, the reception quality being measured on a per time slot basis;

estimating gains for amplifying a second signal of a later received frame, the gains being estimated on a per time slot basis, before a reception period of the later received flame, based on the measured reception quality of individual time slots, and the second signal being amplified to a predetermined reference value;

selecting, on a per frame basis, a maximum gain from the estimated gains of individual time slots;

performing gain contort, on a per time slot basis, during the reception period of the later received frame; and

calibrating an offset voltage of the second signal of the later received frame on a per frame basis, before the reception period of the later received, frame, using a calibration value matching the selected maximum gain.

Specifically, MacNally, Shi, Simmons, Anim-Appiah, Allott, Shibuya, either alone or in combination, fail to teach estimating, before receiving a signal, a gain to be applied to the signal and calibrating an offset voltage, to be applied to a signal, before receiving the signal.

**Claims 19-20 are allowed** because the closes prior art, MacNally, Shi, Simmons, Anim-Appiah, Allott, Shibuya, either alone or in combination, fails to anticipate or render obvious a semiconductor integrated circuit apparatus in a direct conversion reception apparatus for use in a system where transmit power varies between transmission signals by downlink transmit power control, the semiconductor integrated circuit apparatus comprising:

a reception quality measurement circuit that measures reception quality of a first signal of an earlier received frame that is comprised of a plurality of time slots, the reception quality being measured on a per time slot basis;

a gain estimation circuit that estimates gains for amplifying a second signal of a later received frame, the gains being estimated on a per time slot basis, before a reception period of the later received frame, based on the reception quality of individual time slots measured by the reception quality measurement circuit, and the second signal being amplified to a predetermined reference value;

a gain control circuit that selects on a per frame basis, a maximum gain from the gains of individual time slots estimated by the gain estimation circuit, and

Art Unit: 2617

performs gain control, on a per time slot basis, during the reception period of the later received frame; and

a voltage calibration circuit that calibrates an offset voltage of the second signal of the later received frame on a per frame basis, before the reception period of the later received frame, using a calibration value matching the maximum gain selected by the gain control circuit.

Specifically, MacNally, Shi, Simmons, Anim-Appiah, Allott, Shibuya, either alone or in combination, fail to teach estimating, before receiving a signal, a gain to be applied to the signal and calibrating an offset voltage, to be applied to a signal, before receiving the signal.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
